

Name: Suhaib Samir Wadah

A) Answer 5 of the following questions:

- 1- What is MySQL, list some of the companies that use it?
- 2- How to send data to the Web browser, explain that with example?
- 3- Why do we use define() function, explain more with example?
- 4- Why do we use single and double quotation in PHP, which one is better, give an example?
- 5- What are the comparative operators in PHP, explain 3 of them with an example?
- 6- What is associative array, how to declare and print its items, show that with example?
- 7- PHP has functions for incorporating external files, list them down and explain one of them more?
- 8- List down superglobal arrays in PHP, compare between two of them?

2) There are two methods for doing that:

1- Print EX → Print 'welcome to the midterm exam';

2- Echo EX → Echo 'Home Sweet home';

3) Define() is used to define Constant variables (define(Variable , Value)
Ex: define('Name', 'Suhaib');
define('Subject', 'Web development');

4) ① Single quotation: text quoted in single quotation will be treated literally
So putting variables inside single quotation is not a good idea
Ex: \$name = 'suhaib';
echo welcome \$name; output → welcome \$name.

② Double quotation: text quoted in double quotation will be interpreted
So putting variables inside double quotation will result in taking the variable value
Ex: echo "welcome \$name"; output → welcome Suhaib.

1) include() 2) include_once() 3) require() 4) require_once()

* Comparing:

include: with this function we can import files (Php, html, ...) and we can use it more than once in our code.

include_once: using this will also allow us to import files, except when we use it for the first time we can't use it anymore in our code.

5) \$_GET 2) \$_POST 3) \$_REQUEST 4) \$_SERVER 5) \$_COOKIE
6) \$_ENV

* Comparing:

\$_SERVER: will return the ~~the~~ Server version the user is running

\$_COOKIE: It's used to store web data on the user's local machine

B) Choose the correct answer from the following:

(5)

- 1- PHP is an _____ scripting language, meaning that you can intermingle PHP and HTML code within the same file.
a) client-side b) HTML-embedded c) Java-like
- 2- The is_array() function confirms that _____ is of the array type.
a) an object b) a function c) a variable
- 3- _____ path references a file starting from the root directory of the computer.
a) An absolute b) PHP c) Relative
- 4- To determine the number of elements in an array, use _____.
a) size() b) length c) count()
- 5- PHP is case-insensitive when it comes to _____.
a) function names b) variable names c) input names

Mid-Term Test (Model-A)

Name: Kasem Amin Abdullatif Saeed

A) Answer 5 of the following questions.

- 1- Write about PHP history and why to use it?
- 2- Compare between variable and constant, which one is better?
- 3- What is String and how to add two Strings, explain that with example?
- 4- What are the arithmetic operators, explain 3 of them with example?
- 5- How to handle HTML Form in PHP, give an example?
- 6- How to access entire array's elements in PHP and print them out, show that with example?
- 7- Compare between absolute and relative paths, which we use in which case?
- 8- List down superglobal arrays in PHP, compare between two of them?

8) \$-GET, \$-POST, \$-REQUEST, \$-SERVER, \$-SESSION, \$-COOKIE.

The GET is stores all the data are send from the HTML Form by the get method.

The POST is stores all the the data that send from the HTML Form by the post method. ✓ (1)

1) PHP is a stood for "Personal Home page" it was created in 1994 by rasmus Lerdorf to track his online rasmus, it came to known - PHP: Hypertext preprocessor.

2) We use php to developing Dynamic web sites, because php is better, faster and easier to learn than the alternative. What you get when use php is excellent performance, a tight integration, accessing to every database available. ✓ (1)

3) String is a set of character or numbers or spaces written inside Quataions.

\$name = 'Kasem';
\$L_name = "Amin";

We can ~~concat~~ add two string by use the (.) operator.
echo "\$name . \$L_name"; (0,5)

1) include() 2) include_once() 3) require() 4) require_once()

* Comparing:

1) include: with this function we can import files (Php, html, ...) and we can use it more than once in our code.

2) include_once: using this will also allow us to import files, except when we use it for the first time we can't use it anymore in our code.

3) \$_GET 4) \$_POST 5) \$_REQUEST 6) \$_SERVER 7) \$_COOKIE
8) \$_ENV

* Comparing:

1) \$_SERVER: will return the ~~the~~ Server version the user is running

2) \$_COOKIE: It's used to store web data on the user's local machine.

B) Choose the correct answer from the following:

(5)

- 1- PHP is an _____ scripting language, meaning that you can intermingle PHP and HTML code within the same file.
