

PHP Questions Answers

Q.1 What is The Dynamic Web Sites ?

A.1 Dynamic Web sites are flexible and potent creatures, more accurately described as applications than merely sites.

- Characteristics of Dynamic Web Sites :
 - Respond to different parameters (the time of day or the version of the visitor's Web browser).
 - Have a "memory," allowing for user registration and login, e-commerce, and similar processes.
 - allowing visitors to perform searches, provide feedback, and so forth.
 - Often have interfaces where administrators can manage the site's content.
 - Are easier to maintain, upgrade, and build upon than statically made sites.

Q.2 Write What You Know About PHP And Why We Use it ?

A.2 PHP originally stood for "Personal Home Page" as it was created in 1994 by Rasmus Lerdorf to track the visitors to his online résumé.

Q.3 What is PHP and Why We Use PHP ?

A.3 PHP is a scripting language, that stood for "Personal Home Page" as it was created in 1994 by Rasmus Lerdorf to track the visitors to his online résumé.

Q.4 How PHP Works?

A.4 PHP is a server-side language. The server sends Web pages to the requesting visitors, when a visitor goes to a Web site written in PHP, the server reads the PHP code and then processes it according to its scripted directions.

Q.5 What are Variables in PHP, List Down The Variables Naming Syntactical Rules ?

Variables are containers used to temporarily store values.

A.5 syntactical rules:

- A variable's name must start with a dollar sign (\$), for example, \$name.
- The variable's name can contain a combination of letters, numbers, and the underscore, for example, \$my_report1.

- The first character after the dollar sign must be either a letter or an underscore (it cannot be a number).
- Variable names in PHP are case-sensitive.

Q.6 How To Send Data To Web Browser in PHP ?

A.6 PHP has a number of built-in functions for this purpose, the most common being echo and print.

```
echo 'Hello, world!';
```

```
print 'Hello, world!';
```

Q.7 How To Concatenating Strings in PHP, Explain More With Example ?

A.7 It is performed using the concatenation operator, which is (.):

```
$city= 'Seattle';
```

```
$state = 'Washington';
```

```
$address = $city . $state;
```

Q.8 Why Do We Use Define() Function, Explain More With One Example ?

A.8 define() function is used to create Constants.

Example :

- define ('NAME', 'Amr_Alsarori');
- echo 'Hello, ' . NAME

Q.9 List Down Most Common Methods Used With Form and Distinguish Between Them ?

A9 The two options GET and POST refer to the HTTP (Hyper Text Transfer Protocol) method to be used.

The GET method sends the submitted data to the receiving page as a series of name-value pairs appended to the URL.

The POST method is used when an action is expected: the updating of a database record or the sending of an Email.

Q.10 PHP Supports Two Kinds of Arrays List Them Down and Explain one of Them More ?

A.10

indexed, which use numbers as the keys.

associative, which use strings as keys.

with indexed arrays, arrays will begin with the first index at 0, unless you specify the keys explicitly.

Q.11 List Down The Steps We Use in PHP To Communicate With MySQL, And Explain one of Them in Details ?

A.12

- The first step for interacting with MySQL connecting to the server—requires the appropriately named `mysqli_connect()` Function.
- Once you have successfully connected to and selected a database, you can start executing queries by `mysqli_query()`.
- a SELECT query generates information (i.e., it will return rows of records) that has to be handled by other PHP functions. The primary tool for handling SELECT query results is `mysqli_fetch_array()`.

Q.13 What is Cookies Why To Use it in PHP And How To Create one ?

A.13 Cookies are a way for a server to store information on the user's machine.

It's used to track users when traverses a site, and store data in user web browser.

Can be created via the `setcookie()` function: `setcookie (name, value);`

Q.14 What is Constant in PHP, How To Create it and How To Print it?

A.14 Constants are like variables, are used to temporarily store a value but Constants its value cannot be changed during run-time.

to create a constant, you use the define() function : `define ('NAME', value);`

to print it : `echo 'Hello, ' . USERNAME;`

Q.15 What is The Better To Use Single Quotation or Double Quotation Explain Why ?

A.15 The values inside Single Quotation will be treated literally, which means it will take it and show it the browser as it is.

The values inside Double Quotation will be treated interpreted, which means every character will be seen and not as whole will be delivered.

for example : it's used to print a variable value inside a string.

Q.16 What is Validating Form Data and List Down Some of Functions We Use to Do that ?

A.16 It's checking that the user inserted the exact wanted data.

`isset()` : Which is test if variables has value (including 0, FALSE, or an empty string, but not NULL).

`empty()` : It checks if a variable has an empty value: an empty string, 0, NULL, or FALSE.

`is_numeric()` : To test if a submitted value is a number.

Q.17 What is Super Global Arrays in PHP Write More About one of Them ?

A.17 They are a predefined arrays in PHP.

They are: `$_GET`, `$_POST`, `$_REQUEST`, `$_SERVER`, `$_ENV`, `$_SESSION`, and `$_COOKIE`.

The `$_GET` variable is where PHP stores all of the values sent to a PHP script via the GET method.

Q.18 Why Do We Use Single and Double Quotation in PHP, Which One is Better, Give an Example ?

A.18

values enclosed within single quotation marks will be treated literally, whereas those within double quotation marks will be interpreted.

In other words, placing variables and special characters within double quotes will result in their represented values printed, not their literal values

Example :

- `$var = 'test';`
- `echo "var is equal to $var"; // This Result is : var is equal to test`

Q.19 What Are The Comparative Operators in PHP, Example 3 of Them With an Example ?

A.19 They are `==`, `!=`, `<`, `>`, `<=`, `>=`, `!`, `&&`, `||`, `AND`, `OR`, `XOR`

1- `==` example : `$x == $y`, 2- `!=` example : `$x != $y`, 3 - `>` example : `$x > $y`

Q.20 What is Associative Array, How To Declare it And Print it's Items Show That With One Example ?

A.20 associative, keys of it's Items Will Be Strings Such As (`Arr ['MD']` , `Arr ['PA']`, ... etc.).

Example :

- `$states = array (`
- `'IA' => 'Iowa',`
- `'MD' => 'Maryland' );`
- `echo $states ['IA'] , '<br>' , $states['MD'];`

Q.21 How to send data to the client and why we need to?

A.21 sending data to client(web browser) can be by echo or print language constructs.
We need it to send html code or string to web browser.

Q.22 Compare between absolute and relative path, which we use in which case?

A22.

An absolute path references a file starting from the root directory of the computer.

Used when referencing an asset outside the project.

A relative path uses the referencing (parent) file as the starting point. To move up one folder, use two periods together.

Used when referencing an asset inside the project.

Q.23 What are the common PHP errors, explain one of them more ?

A23

- Syntactical
- Run-time
- Logical

Run-time errors include those things that don't stop a PHP script from executing (like parse errors do) but do stop the script from doing everything it was supposed to do.
